

Good work. In good order.

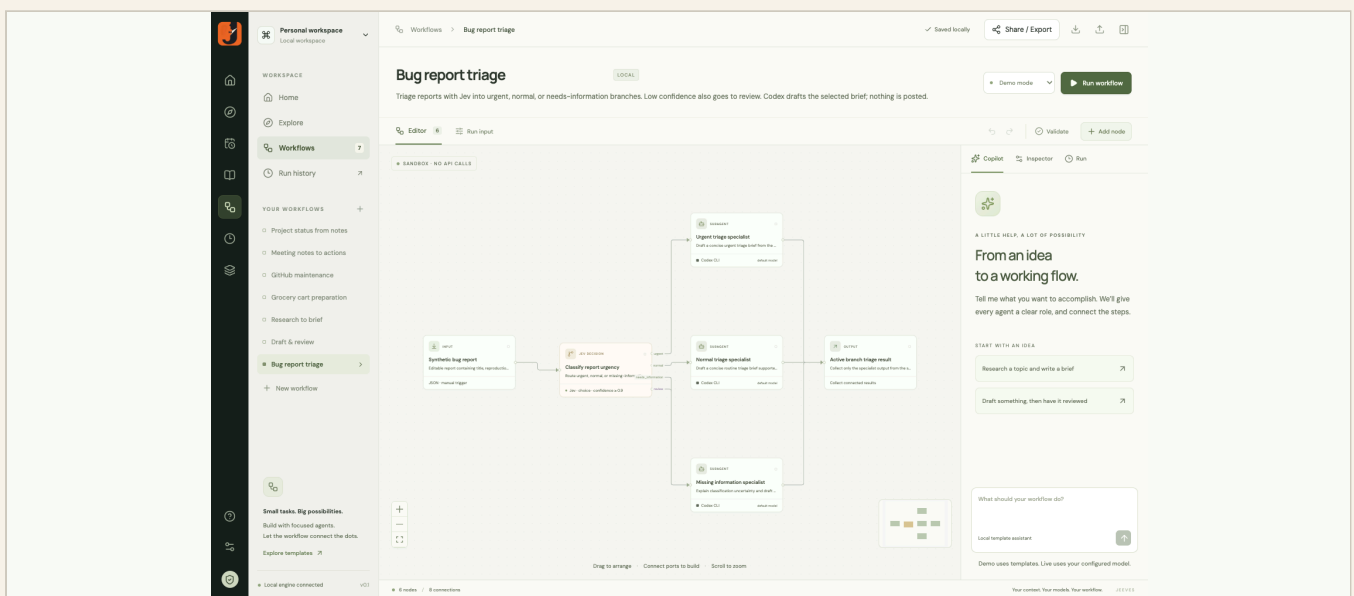

Local-first workflows for your AI agents. Start in chat, connect focused steps, and keep a process you can run again.

No Jeeves account

Your models

Visible decisions

Portable skills

Actual interface · isolated demo workspace · synthetic example

Give each agent a job.

Connect agents, Jev decisions, API actions, and handoffs in a visual graph. Assign installed skills to the steps that need them.

Take the workflow along.

Export a workflow as a portable skill with its runner and requirements. A compatible harness can run it without the Jeeves app open.

Keep the result in view.

Review task input before launch. Follow progress, inspect the trace, and read the output. Schedule repeat work while the engine runs.

Start with real work.

Draft a maintainer brief, triage a bug report, turn meeting notes into actions, or prepare a project status update.

Workflows, chats, and history stay on your computer. Live cloud providers receive task context. Provider credentials and external tools may be required. Portable skills require Node.js 22.12+ and compatible execution permissions. Preview build verified on macOS Apple Silicon; unsigned. Public availability has not been announced.
